Coding Task Solution by El Hadji Momar Fall

Commit history:

- Step 1:

Creation of the project: Project name and Initialization.

- Step 2:

Implementation: Coding

Creation of the model DTO, creation of the services, implementation of the services, creation of the repositories and creation of the controllers.

Creation of static variables.

Configuration

I have chosen H2 database, in-memory variant which is volatile, and the data is lost on application restart. The database is up and running on application start. Postman must be enough for the interaction with Rest API and H2. Still H2 Console is available at <http://localhost:8080/h2-console/>. Employ 'sa' as user name and 'fall' as password to log into.

Specifications:

Only the drones with IDLE or LOADING status may be available

Drone weight is actually the weight of loaded medications

The check for the drones available for loading takes the following requirements into account:

the drone must be prevented from being in LOADING state if the battery level (capacity) is below 25%

loading each new medication increases the drone weight so keep an eye on the overload. - loading process results in the status change for LOADING if only the overall weight of loaded medications does not exceed the weight limit of 500 g - when the weight limit is reached, the message 'medication overall weight exceeds allowed limit' is issued Adding a new drone is possible only if drone fleet size limit (10) is not exceeded - the message 'no more drones can be registered' is shown.

```
